Man

This tabulated data is a general set of guidelines and tables to assist the competent person in selecting a safety system and the proper shoring or shielding equipment. The competent person has sole responsibility for job site safety and the proper selection and installation and removal of the shoring or shielding equipment.

This tabulated data is not intended to be used as a job specific excavation safety plan, but shall be used by the competent person to supplement his training, his experience and his knowledge of the job conditions and soil type.

1. The Modular Trench Shielding System tabulated data is based on the OSHA Safety requirements defined in 29 CFR, Part 1926, Subpart P - Excavations and Trenches.
2. This data is to be used by a soils engineer, or a competent person. The competent person shall be experienced and knowledgeable of trenching and excavation procedures, the use of modular trench shielding systems, soils identification, and the OSHA standards.
a. A trained competent person shall: supervise all excavation operations; ensure that all personnel are working in safe conditions; and have thorough knowledge of this tabulated data. The competent person shall have the authority to stop work when it is unsafe for workers to enter an excavation.
b. All personnel shall be trained in correct excavation procedures, proper use of the protective system and all safety precautions.
c. Excavations and protective systems shall be inspected a minimum of once each working day and whenever there is a change of soil, water, or other job site conditions.
d. All lifting and pulling equipment, including cables, slings, chains, shackles and safety hooks shall be evaluated for suitability and capacity, and shall be inspected for damage or defects prior to use.
3. The competent person shall continually monitor the excavation for signs of deterioration such as seepage of water or flowing soil into the excavation. Promptly de-water any accumulated water and reassess the trench for safety. Changing soil conditions may require adjustments to the shoring system.
a. All installation and removal of shielding or shoring shall be from above ground only.
b. Do not allow personnel to enter an excavation that is not properly shored, shielded or sloped.
c. Personnel shall always work within the shielding or shoring. Personnel shall not stand on the edge of an un-shored excavation.
d. All personnel shall enter and exit excavations only within shielded or shored areas.
4. The tabulated data shall only be used for those soil conditions indicated. The data is not considered adequate when loads imposed by structures, equipment, traffic, or stored materials adjacent to the trench exceed the assumed design surcharge loads of 20,000 pounds, or the imposed load of a 2 ft . spoil pile located less than 2 ft . from the edge of the excavation. An engineered shielding or shoring design is required for conditions other than those assumed in the tables.
5. Proper backfill sufficient to stabilize the Modular Shield and to minimize ground surface and/or foundation settlements is required. Where such settlements are not a concern, over digging may be performed, however, the clear distance shall not exceed 6 inches.
6. No vertical or horizontal loads shall be applied to the adjustable strut/spreader or static braces except as specified by the Manufacturer. Any mishandling, such as pounding with the backhoe bucket, will void the tabulated data.

## SHORING PRODUCTS

## Classification of Soil Types

The soil descriptions for OSHA Type "A", "B", \& "C" Soils are based on Appendix A to OSHA Subpart P of 29CFR Part 1926, "Excavations and Trenches". The Type "C-60" Soil referred to in Manufacturer's Tabulated Data represents a more stable soil condition than the Type "C" described in Appendix A.

Type "A" Soil - Effective lateral weight of 25 PSF per foot of depth.
Description: Cohesive soil (i.e.. slay, silty clay, sandy clay, clay loam) with an unconfined compressive strength of 1.5 TSF (tons per square foot) or greater; or cemented soils such as caliche and hardpan. No soil is Type A if the soil is fissured; subject to vibration from heavy traffic, pile driving or similar effects; has been previously disturbed; or part of a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical ( $4 \mathrm{H}: 1 \mathrm{~V}$ ) or greater.

Type "B" Soil - Effective lateral weight of 45 PSF per foot of depth.
Description: Cohesive soil with an unconfined compressive strength greater than .5 TSF but less than 1.5 TSF; and granular cohesionless soils including angular gravel, silt, silt loam, sandy loam, and in some cases, silty clay loam and sand clay loam; previously disturbed soils except those which would otherwise be classed as Type C; soil that meets requirements for Type A, but is fissured or subject to vibration; dry rock that is unstable; and material that is part of a layered system where layers dip into the excavation on a slope less steep than four horizontal to one vertical $(4 \mathrm{H}: 1 \mathrm{~V})$, but only if the material would otherwise be classified as Type B.

Type "C-60" Soil - Effective lateral weight of 60 PSF per foot of depth.
Description: Soft cohesive to moist soil with an unconfined compressive strength less than .5 TSF; moist cohesive soil or moist dense sand which is not flowing or submerged. When cut with near vertical side walls, soil can stand with unsupported vertical sidewalls long enough for shoring installation. (see "1.c.")

Type "C-80" Soil - Effective lateral weight of $\mathbf{8 0}$ PSF per foot of depth.
Description: Cohesive soil with an unconfirmed compressive strength of .5 TSF or less; granular soils including gravel, sand, and loamy sand; submerged soil or soil from which water is freely seeping; submerged rock that is not stable; and material in a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical ( $4 \mathrm{H}: 1 \mathrm{~V}$ ) or steeper.

## SHORING PRODUCTS

A. When only the lower portion of a trench is to be shored and the remaining portion is benched or sloped at an angle steeper than three horizontal to one vertical ( $3 \mathrm{H}: 1 \mathrm{~V}$ ), the allowable depth of excavation shall be measured from the top of the overall trench and not the toe of the sloped portion.
B. In sloped excavations, the top of the shield must be a minimum of 18 inches above the bottom of the slope and the top struts/spreaders must be located below the bottom of the slope. In unsloped excavations, the top of the shield may be flush with the ground surface, provided that the competent person determines that there is no hazard of objects rolling into the excavation.
C. Modular Trench Shielding Systems shall be used with Manufacturer's adjustable struts/spreaders and static braces pinned in place with two (2) Manufacturer supplied $5 / 8^{\prime \prime}$ diameter pins at each end of the strut/spreader or brace as illustrated on page 5 .
D. Modular Trench Shielding Systems shall be assembled and installed as shown and in accordance with these instructions.
E. Modular Trench Shielding Systems shall be handled by using the lifting lugs installed in holes provided in each panel or corner post. Stacking Brackets shall be used when stacking modular systems.
F. The bottom of the Modular Shield shall be located no more than two feet from the bottom of the excavation in soil Types "A", "B" and "C-60\80" as long as no loss of soil from behind or below the shield is encountered. Proper benching of trench wall is required.

## SHORING PRODUCTS

## Two-Sided Configurations

Two-sided configuration with telescoping spreaders and full length corner posts

Two-sided configuration with full length corner posts and arches

A series of two-sided configured Modular Shield shielding a long pipeline

## Three-Sided Configurations

Three-sided configuration with telescoping spreaders and removed bottom panel

A three-sided configuration with end panels pinned 1 ft . up in corner posts allowing gas utility to run through

Three-sided configuration with spreaders on long side and removed bottom panels to straddle pipe

## Four-Sided Configurations

Four-sided configuration with sectional corner posts and removed bottom panel

Long paneled four-sided configuration with sectional corner posts

Two, $8 \times 8 \times 8 \mathrm{ft}$. stacked Modular Shields with Stacking Guides
Build-A-Box - Tabulated Data

## SHORING PRODUCTS

* Always install pins with handle on the outside; ** Arch or Sheeting Guide Frames can substitude spreaders

## NOTES

1. Assemble on level ground.
2. Lift with factory supplied lift eyes.
3. All matching holes must have a pin and keeper.
4. System must be used in accordance to manufactures tabulated data.
5. Bottom panel may be omitted, allowing 2 feet open clearance, only if there is no possible loss of soil from behind or below the bottom of the shield.

## SHORING PRODUCTS

NOTE: Remove pins \& keepers one at a time from one spreader, post, or panel. DO NOT REMOVE ALL PINS AND KEEPERS AT ONE TIME.

Step 1
Unpin and remove ONE corner post connecting FRONT Panels (or spreaders) and SIDE Panels.

Step 2
Unpin and remove FRONT Panels (or spreaders) and SIDE Panels from corner posts; working from top to bottom.

Step 3
Unpin and remove corner posts on open ends of remaining SIDE Panels and BACK Panels, leaving one corner post pinned to SIDE and BACK Panels. (This will keep the remaining system balanced.)

Step 4
Unpin and remove remaining panels from top to bottom, alternating between SIDE panels and BACK panels.

Build-A-Box - Tabulated Data

## SHORING PRODUCTS

## Step 3

Finish installing all Side Panels, alternating one side then the other. Secure with pins and keepers. Once system is 6 ' high, the Arch support can be

Note: Use Build-A-Box tabulated data charts providing vertical clearance is 6'-6" or less and horizontal clearance is $14^{\prime}$ or less.

## Step 2

With the Arch still supported, pin FULL-LENGTH Corner Posts 7' or longer onto Arches, and begin installing side panels. Secure Corner Posts and Panels with pins and keepers.

Step 4
Slide Corner Posts onto ends of Side Panels and secure with pins and keepers. Complete the fourth side by installing either spreaders, Sheeting Guide Frame, or another Arch.

Build-A-Box - Tabulated Data

## SHORING PRODUCTS

Step 1
Excavate to grade just slightly wider than Modular Shield dimension. Dig walls vertical to minimum of 18 in. below the top of the box. Slope soil above box according to manufacturer's tabulated data.

## Step 2

Lower box into trench. Backfill between outside wall of the box and wall of the trench before use.

All Lifting Devices should be properly sized, designed, and used in compliance with all industry regulations and in conjunction with a trained and knowledgeable rigging and lifting expert's recommendations.

# ARCOSA <br> <br> SHORING PRODUCTS 

 <br> <br> SHORING PRODUCTS}
(1) Numerous other combinations of panels, corner posts, t-posts, 4-way posts and struts/ spreaders, other than those shown on page 7, are permissible with approval from the manufacturer.
(2) Modular Shield panels each have four or six holes for connector pins on each side. A minimum of two of the four pins must be used in order for the manufacturer's tabulated data to remain valid. If sectional corner posts are used intersecting at the mid-point of the panel on the 2' high side, then a minimum of one pin must be used per on each of the two intersecting corner posts (two per panel). The other pins add rigidity and redundancy, but are not required.
(3) Modular Trench Shielding Systems, are designed for use with Manufacturer's adjustable struts/spreaders and static braces.
(4) Depth ratings are based on one strut/spreader per sectional corner post pair on 24 inch centers for the entire height of the system. Sectional corner posts must be installed in a manner to have the struts/spreaders centered on the posts and in line with the panel joints. Alternately, struts/spreaders may be used on 36 inch vertical centers if used with full length end posts. The full length end posts must extend to within 12 inches of the top and bottom of the panels. Full length corner posts may extend below the bottom of the panels to serve as legs; however depth of cut remains the same.

Build-A-Box - Tabulated Data

## Full Length Corner Posts

BUILD-A-BOX STACKING GUIDE

STACKING GUIDE WITH 4-SIDED BUILD-BOX (Minimum 4 required)

BUILD-A-BOX PANEL STACKED ON (EPI) ALUMINUM TRENCH SHIELD WITH STACKING GUIDES

Three-sided (EPI) Alum. Shield with Stacked Modular Panels

Four-sided (EPI) Alum. Shield with Stacked Modular Panels

1. Corner Posts must extend a minimum of 1 ft . both below and above the intersection of the Modular Shield panel on the Aluminum Trench Shield
2. For two and three-sided systems, spreaders must be located at the intersection of the Modular Panel and the Aluminum Trench Shield, and vertically per the Tabulated Data.
3. Follow the Tabulated Data charts for additional stacked Modular Shield assemblies.

STANDARD PANELS (BAB-\#)
STANDARD PANELS (BAB-\#)

NOTES:

1. Build-A-Box Guide Frames will replace standard panels in any configuration
2. For use with Full-Length Corner Posts only
3. All pins and keepers must be installed into guide frame
4. Guide frames must be offset to the inside of the excavation
5. At least one standard Build-A-Box panel must be installed above the guide frame

SUBJECT:
Build-A Box System Octagon Configuration

## General Notes:

This Technical Data Sheet is in addition to EPI's Tabulated Data for Build-A-Box Modular Trench Shielding System.

- All personnel involved with the use of the Build-A Box System Octagon Configuration shall be trained in the proper use and installation procedures and other applicable safety requirements.
- The maximum depth of the excavation shall not exceed $20-\mathrm{ft}$. and the soil is classified as $\mathbf{C 6 0}$ soil in accordance with the above referenced Tabulated Data.
- The Build-A Box System Octagon Configuration shall have a minimum height of 6 -ft.
- All components shall be positioned in accordance with Figure(1.1) and Table (1.1) prior to employees entering the excavation. Refer to the installation procedures for typical installation figures.
- The system shall be installed in a manner to prevent lateral or otherwise hazardous movement. The Build-A Box panels shall backfilled against at least $2 / 3$ of the total height of the configuration.
- This data is valid for components in structurally sound condition. Any significant damage will void this data, and all manufacturers' warranty. The damaged components shall not be used.
- Bottom panels may be left out as indicated in Figure(1.2).
- Surcharge loads are not included in the maximum depth tables. Surcharge loads are possible due to heavy equipment, vibrations, or soil piles adjacent to the trench. (Adjacent is defined as within a distance equal to the depth of the trench.)
