Code Compliance:The Build-A-Box ${ }^{\text {TM }}$ Modular Aluminum Trench Shielding System com-plies with requirements of EN 12221-1\&2: 2002, DIN 4124, DIN EN12811, and DIN EN 14693

Man

This tabulated data is a general set of guidelines and tables to assist the competent person in selecting a safety system and the proper shoring or shielding equipment. The competent person has sole responsibility for job site safety and the proper selection and installation and removal of the shoring or shielding equipment.

This tabulated data is not intended to be used as a job specific excavation safety plan, but shall be used by the competent person to supplement his training, his experience and his knowledge of the job conditions and soil type.

1. The BUILD-A-BOX ${ }^{\text {TM }}$ Modular Trench Shielding System tabulated data is based on the OSHA Safety requirements defined in 29 CFR, Part 1926, Subpart P - Excavations and Trenches.
2. This data is to be used by a soils engineer, or a competent person. The competent person shall be experienced and knowledgeable of trenching and excavation procedures, the use of modular trench shielding systems, soils identification, and the OSHA standards.
a. A trained competent person shall: supervise all excavation operations; ensure that all personnel are working in safe conditions; and have thorough knowledge of this tabulated data. The competent person shall have the authority to stop work when it is unsafe for workers to enter an excavation.
b. All personnel shall be trained in correct excavation procedures, proper use of the protective system and all safety precautions.
c. Excavations and protective systems shall be inspected a minimum of once each working day and whenever there is a change of soil, water, or other job site conditions.
d. All lifting and pulling equipment, including cables, slings, chains, shackles and safety hooks shall be evaluated for suitability and capacity, and shall be inspected for damage or defects prior to use.
3. The competent person shall continually monitor the excavation for signs of deterioration such as seepage of water or flowing soil into the excavation. Promptly dewater any accumulated water and reassess the trench for safety. Changing soil conditions may require adjustments to the shoring system.
a. All installation and removal of shielding or shoring shall be from above ground only.
b. Do not allow personnel to enter an excavation that is not properly shored, shielded or sloped.
c. Personnel shall always work within the shielding or shoring. Personnel shall not stand on the edge of an un-shored excavation.
d. All personnel shall enter and exit excavations only within shielded or shored areas.
4. The tabulated data shall only be used for those soil conditions indicated. The data is not considered adequate when loads imposed by structures, equipment, traffic, or stored materials adjacent to the trench exceed the assumed design surcharge loads of $9,080 \mathrm{~kg}$, or the imposed load of a 600 mm spoil pile located less than 600 mm from the edge of the excavation. An engineered shielding or shoring design is required for conditions other than those assumed in the tables.
5. Proper backfill sufficient to stabilize the BUILD-A-BOX ${ }^{\text {TM }}$ and to minimize ground surface and/or foundation settlements is required. Where such settlements are not a concern, over digging may be performed, however, the clear distance shall not exceed 150 mm .
6. No vertical or horizontal loads shall be applied to the adjustable strut or static braces except as specified by Efficiency Production. Any mishandling, such as pounding with the backhoe bucket, will void the tabulated data.

## SHORING PRODUCTS

## Classification of Soil Types

The soil descriptions for OSHA Type "A", "B", \& "C" Soils are based on Appendix A to OSHA Subpart P of 29CFR Part 1926, "Excavations and Trenches". The Type "C-60" Soil referred to in Efficiency's Tabulated Data represents a more stable soil condition than the Type "C" described in Appendix A.

Type "A" Soil - Effective lateral weight of 25 PSF per foot of depth.
Description: Cohesive soil (i.e.. slay, silty clay, sandy clay, clay loam) with an unconfined compressive strength of 1.5 TSF (tons per square foot) or greater; or cemented soils such as caliche and hardpan. No soil is Type A if the soil is fissured; subject to vibration from heavy traffic, pile driving or similar effects; has been previously disturbed; or part of a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical ( $4 \mathrm{H}: 1 \mathrm{~V}$ ) or greater.

Type "B" Soil - Effective lateral weight of 45 PSF per foot of depth.
Description: Cohesive soil with an unconfined compressive strength greater than .5 TSF but less than 1.5 TSF; and granular cohesionless soils including angular gravel, silt, silt loam, sandy loam, and in some cases, silty clay loam and sand clay loam; previously disturbed soils except those which would otherwise be classed as Type C; soil that meets requirements for Type A, but is fissured or subject to vibration; dry rock that is unstable; and material that is part of a layered system where layers dip into the excavation on a slope less steep than four horizontal to one vertical $(4 \mathrm{H}: 1 \mathrm{~V})$, but only if the material would otherwise be classified as Type B.

Type "C-60" Soil - Effective lateral weight of 60 PSF per foot of depth.
Description: Soft cohesive to moist soil with an unconfined compressive strength less than .5 TSF; moist cohesive soil or moist dense sand which is not flowing or submerged. When cut with near vertical side walls, soil can stand with unsupported vertical sidewalls long enough for shoring installation. (see "1.c.")

Type "C-80" Soil - Effective lateral weight of $\mathbf{8 0}$ PSF per foot of depth.
Description: Cohesive soil with an unconfirmed compressive strength of .5 TSF or less; granular soils including gravel, sand, and loamy sand; submerged soil or soil from which water is freely seeping; submerged rock that is not stable; and material in a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical ( $4 \mathrm{H}: 1 \mathrm{~V}$ ) or steeper.

## SHORING PRODUCTS

A. When only the lower portion of a trench is to be shored and the remaining portion is benched or sloped at an angle steeper than three horizontal to one vertical ( $3 \mathrm{H}: 1 \mathrm{~V}$ ), the allowable depth of excavation shall be measured from the top of the overall trench and not the toe of the sloped portion.
B. In sloped excavations, the top of the shield must be a minimum of 460 mm above the bottom of the slope and the top struts/braces must be located below the bottom of the slope. In unsloped excavations, the top of the shield may be flush with the ground surface, provided that the competent person determines that there is no hazard of objects rolling into the excavation.
C. BUILD-A-BOX ${ }^{\text {TM }}$ Modular Trench Shield Systems shall be used with Efficiency Production adjustable struts and static braces pinned in place with two (2) Efficiency Production supplied 20 mm diameter pins at each end of the strut or brace as illustrated on page 5.
D. BUILD-A-BOX ${ }^{\text {TM }}$ Modular Trench Shield Systems shall be assembled and installed as shown and in accordance with these instructions. Note that installation videos and training at Efficiency Production are available upon request.
E. BUILD-A-BOX ${ }^{\top M}$ Modular Trench Shield Systems shall be handled by using the lifting lugs installed in holes provided in each panel or corner post. Stacking Brackets shall be used when stacking modular systems.
F. The bottom of the BUILD-A-BOX ${ }^{\text {TM }}$ shall be located no more than two feet from the bottom of the excavation in soil Types "A", "B" and "C-60180" as long as no loss of soil from behind or below the shield is encountered. Proper benching of trench wall is required.

## SHORING PRODUCTS

## Two-Sided Configurations

Two-sided configuration with telescoping spreaders and full length corner posts

Two-sided configuration with full length corner posts and arches

A series of two-sided configured Build-A-Box shielding a long pipeline

Three-Sided Configurations

Three-sided configuration with telescoping spreaders and removed bottom panel

A three-sided configuration with end panels pinned 305 mm up in corner posts allowing gas utility to run through

Large, three-sided configuration with hi-clearance arches

Four-sided Build-A-Box with Sheeting Guide Frame and sheets

## SHORING PRODUCTS

## Step 1

Slide first panel into corner post and pin in place. Slide perpendicular panel into the corner posts and pin in place.
Continue with as many panels as necessary to achieve desired height. Be sure to secure with pins and keepers.

## Step 2

Slide corner posts onto panels and pin in place. Be sure to secure with pins and keepers.

## SHORING PRODUCTS

## Step 3

To complete the third side, slide panels into the corner posts and pin in place. Add corner posts onto the panel and pin in place. Be sure to secure with pins and keepers.

## Step 4a

To assemble last side, slide panels down into corner posts until desired height is achieved. Pin panels to corner posts. Be sure to secure with pins and keepers.

## Step 4b

Or, slide a pair of telescoping spreaders into corner posts and secure with pins and keepers. Note: At least two spreaders are required.

Build-A-Box - Tabulated Data

## SHORING PRODUCTS

## Step 3

Finish installing all Side Panels, alternating one side then the other. Secure with pins and keepers. Once system is 6 ' high, the Arch support can be

Note: Use Build-A-Box tabulated data charts providing vertical clearance is 2 m or less and horizontal clearance is 4.27 m or less.

Step 4

With the Arch still supported, pin FULL-LENGTH Corner Posts 2.1 m or longer onto Arches, and begin installing side panels. Secure Corner Posts and Panels with pins and keepers.

Slide Corner Posts onto ends of Side Panels and secure with pins and keepers. Complete the fourth side by installing either spreaders, Sheeting Guide Frame, or another Arch.

Build-A-Box - Tabulated Data

## SHORING PRODUCTS

Step 1
Excavate to grade just slightly wider than Build-A-Box dimension. Dig walls vertical to minimum of 460 mm below the top of the box. Slope soil above box according to manufacturer's tabulated data.

## Step 2

Lower box into trench. Backfill between outside wall of the box and wall of the trench before use.

All Lifting Devices should be properly sized, designed, and used in compliance with all industry regulations and in conjunction with a trained and knowledgeable rigging and lifting expert's recommendations.

## SHORING PRODUCTS

1) Numerous other combinations of panels, corner posts, t-posts, 4-way posts and struts, other than those shown on page 7, are permissible with approval from Efficiency Production.
(2) Build-A-Box panels each have four or six holes for connector pins on each side. A minimum of two of the four pins must be used in order for the manufacturer's tabulated data to remain valid. If sectional corner posts are used intersecting at the mid-point of the panel on the 2' high side, then a minimum of one pin must be used per on each of the two intersecting corner posts (two per panel). The other pins add rigidity and redundancy, but are not required.
(3) Build-A-Box ${ }^{\text {TM }}$ Modular Trench Shielding Systems, are designed for use with Efficiency Production adjustable struts and static braces.
(4) Depth ratings are based on one strut per sectional corner post pair on 610 mm centers for the entire height of the system. Sectional corner posts must be installed in a manner to have the struts centered on the posts and in line with the panel joints. Alternately, struts may be used on 920 mm vertical centers if used with full length end posts. The full length end posts must extend to within 305 mm of the top and bottom of the panels. Full length corner posts may extend below the bottom of the panels to serve as legs; however depth of cut remains the same.
(5) When t-posts or 4-way corner posts are used, struts must be installed at every t-post and/ or corner post, on the same maximum vertical centers as the ends.
(6) Each wheel kit assembly may be used to lift a maximum of 681 kg . Two wheel kits are required per panel section.
(7) 1.2 or 1.8 mm tall panels with or without factory installed cutouts may be substituted for two or three, 0.6 mm panels with no penalty in depth of cut.

BUILD-A-BOX STACKING GUIDE

STACKING GUIDE WITH

BUILD-A-BOX PANEL STACKED ON (EPI) ALUMINUM TRENCH SHIELD WITH STACKING GUIDES

Three-sided XLAP with Stacked Build-A-Box Panel

Four-sided XLAP with Stacked Build-A-Box Panel

1. Corner Posts must extend a minimum of 1 ft . both below and above the intersection of the Build-ABox panel on the XLAP Aluminum Trench Shield.
2. One (1) pin per foot with BAB Corner Posts is required, or 2 pins per seam.
3. For two and three-sided systems, struts (spreaders) must be located at the intersection of the Build-A-Box panel and the XLAP Aluminum Trench Shield, and vertically per the Tabulated Data.
4. Follow the Tabulated Data charts for additional stacked Build-A-Box assemblies.

## Octagon Configuration

DATE:
May 29, 2019
SUBJECT:
Build-A Box System Octagon Configuration

## General Notes:

This Technical Data Sheet is in addition to EPI's Tabulated Data for Build-A-Box Modular Trench Shielding System.

- All personnel involved with the use of the Build-A Box System Octagon Configuration shall be trained in the proper use and installation procedures and other applicable safety requirements.
- The maximum depth of the excavation shall not exceed $20-\mathrm{ft}$. and the soil is classified as $\mathbf{C 6 0}$ soil in accordance with the above referenced Tabulated Data.
- The Build-A Box System Octagon Configuration shall have a minimum height of $6-\mathrm{ft}$.
- All components shall be positioned in accordance with Figure(1.1) and Table (1.1) prior to employees entering the excavation. Refer to the installation procedures for typical installation figures.
- The system shall be installed in a manner to prevent lateral or otherwise hazardous movement. The Build-A Box panels shall backfilled against at least $2 / 3$ of the total height of the configuration.
- This data is valid for components in structurally sound condition. Any significant damage will void this data, and all manufacturers' warranty. The damaged components shall not be used.
- Bottom panels may be left out as indicated in Figure(1.2).
- Surcharge loads are not included in the maximum depth tables.
